

Why is LYPO-SPHERIC VITAMIN C made in sachets and not in capsules or a bottle?

To manufacture a true liposomal product, water is an essential ingredient. Water would melt a capsule and thus cannot be used. Products claiming to be liposomal that are sold in capsules may not be liposomal products and more likely to be a simple emulsion.

Sachets are an excellent way to protect the vitamin C and deliver it without risk of oxidation. Oxidation would harm the vitamin C and this why Livon would never consider selling their product in a bottle.

The reason for the success of the Livon vitamin C is because the company has invested a lot of money over the past 12 years to ensure their product has stable liposomes. Unless this can be achieved they could not claim to have a true liposomal product. Stable liposomes are the ultimate goal with manufacturing.

When purchasing a liposomal product it's important to know that the product is true to label. Ask if you are not sure.
